OpenEye Radius / RediWatch

The OpenEye Radius NDMS (Network DVR Management System) has the ability to interface with any AVE POS / ATM Interface. The RediWatch software is an upgrade to this NDMS software to do the POS Interface.

Direct Connect ASCII

The AVE VSI-Pro, VSI-Pro Max, P2RS, P2RS-Pro or TCPIP232 all support direct formatted transaction data output from their RS-232 ports. This data is directly connected to a ComPort of the receiving device running the RediWatch software.

Vnetworker, Networker or RegCom Networking

The VSI-Pro Max, P2RS-Pro or TCPIP232 all support direct RS-485 slave device mode between each other and a master control unit. The master unit can be either a VSI-Pro Max or Hydra which then outputs the AVE VSI-ADD protocol which contains all the POS data from up to 16 devices and delivers this to one RS-232. The RediWatch supports this mode by selecting AVE V2 mode.
